Aerosol Phase Function Monitoring "II"

Auger Collaboration Meeting

Malargue, Argentina

John A.J. Matthews

New Mexico Center for Particle Physics

University of New Mexico

April 26, 2002

1. Air Cherenkov Correction to Fluorescence Signal
2. Aerosol Phase Function Measurement ... Concept
3. Dedicated APF Light Source:
   - Design
   - Test at HiRes
   - Status of Coihueco Installation
4. ~~Summary~~ "THREE" issues:
   i) APF glancing shot DAQ implications
   ii) "TRIPLE POINT" vertical lasers
   iii) Dedicated "flat field" N_2 lasers.

Simulations (and event reconstruction):

a) $\gamma_{fluorescence}(\lambda)$ $\qquad + T^m T^a$

b) $\gamma_C(\lambda, \theta)$ + single scatter (into F.D. F.O.V.) $\qquad + T^m T^a$

- $\gamma_C(\lambda, \theta)$: θ with respect to the shower axes
- single scatter: need $\Lambda(z, \lambda)$ and $\frac{1}{\sigma}\frac{d\sigma}{d\Omega}$
- $T^m T^a$: need $\Lambda(z, \lambda)$

m ≡ molecular/Rayleigh
a ≡ aerosol/Mie

where: $T(z, \lambda, \alpha_{viewing}) = e^{-\tau(z,\lambda)/\sin\alpha_{viewing}}$

$$\tau(z,\lambda) = \int_0^z \frac{dz}{\Lambda(z,\lambda)}$$

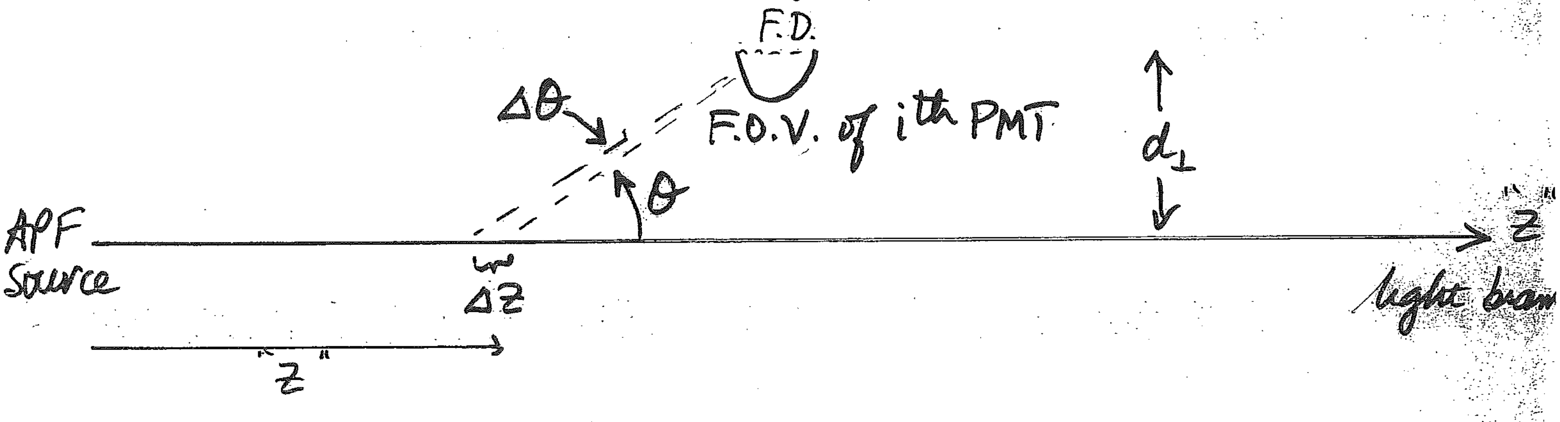
Components of Detected Light

"A.P.F. light source geometry"



$$\text{Signal}_i = I \times \frac{\Delta z}{\Lambda^m} \times \left(\left(\frac{1}{\sigma}\frac{d\sigma}{d\Omega}\right)^m + \frac{\Lambda^m}{\Lambda^a}\left(\frac{1}{\sigma}\frac{d\sigma}{d\Omega}\right)^a \right) \Delta\Omega_i \varepsilon_i$$

where: $\Delta z = \dfrac{d^2 \Delta\theta}{d_\perp}$

$$\Delta\Omega_i \doteq \frac{\text{Area (Telescope Aperture)}}{d^2}$$

$$I = I_{source}\, e^{-z/\Lambda_{TOT}} \approx I_{source} \text{ for } z \ll \Lambda_{TOT}$$

$\dfrac{\Lambda^m}{\Lambda^a} \simeq 1$ (typically) and measured by H.A.M.'s

$$\therefore \text{Signal}_i \approx \frac{\text{Area}}{d_\perp} \underbrace{\left(\left(\frac{1}{\sigma}\frac{d\sigma}{d\Omega}\right)^m + \frac{\Lambda^m}{\Lambda^a}\left(\frac{1}{\sigma}\frac{d\sigma}{d\Omega}\right)^a \right)} \Delta\theta\, I_{source}\, \varepsilon_i$$

"sum" of molecular (Rayleigh) and aerosol phase functions.

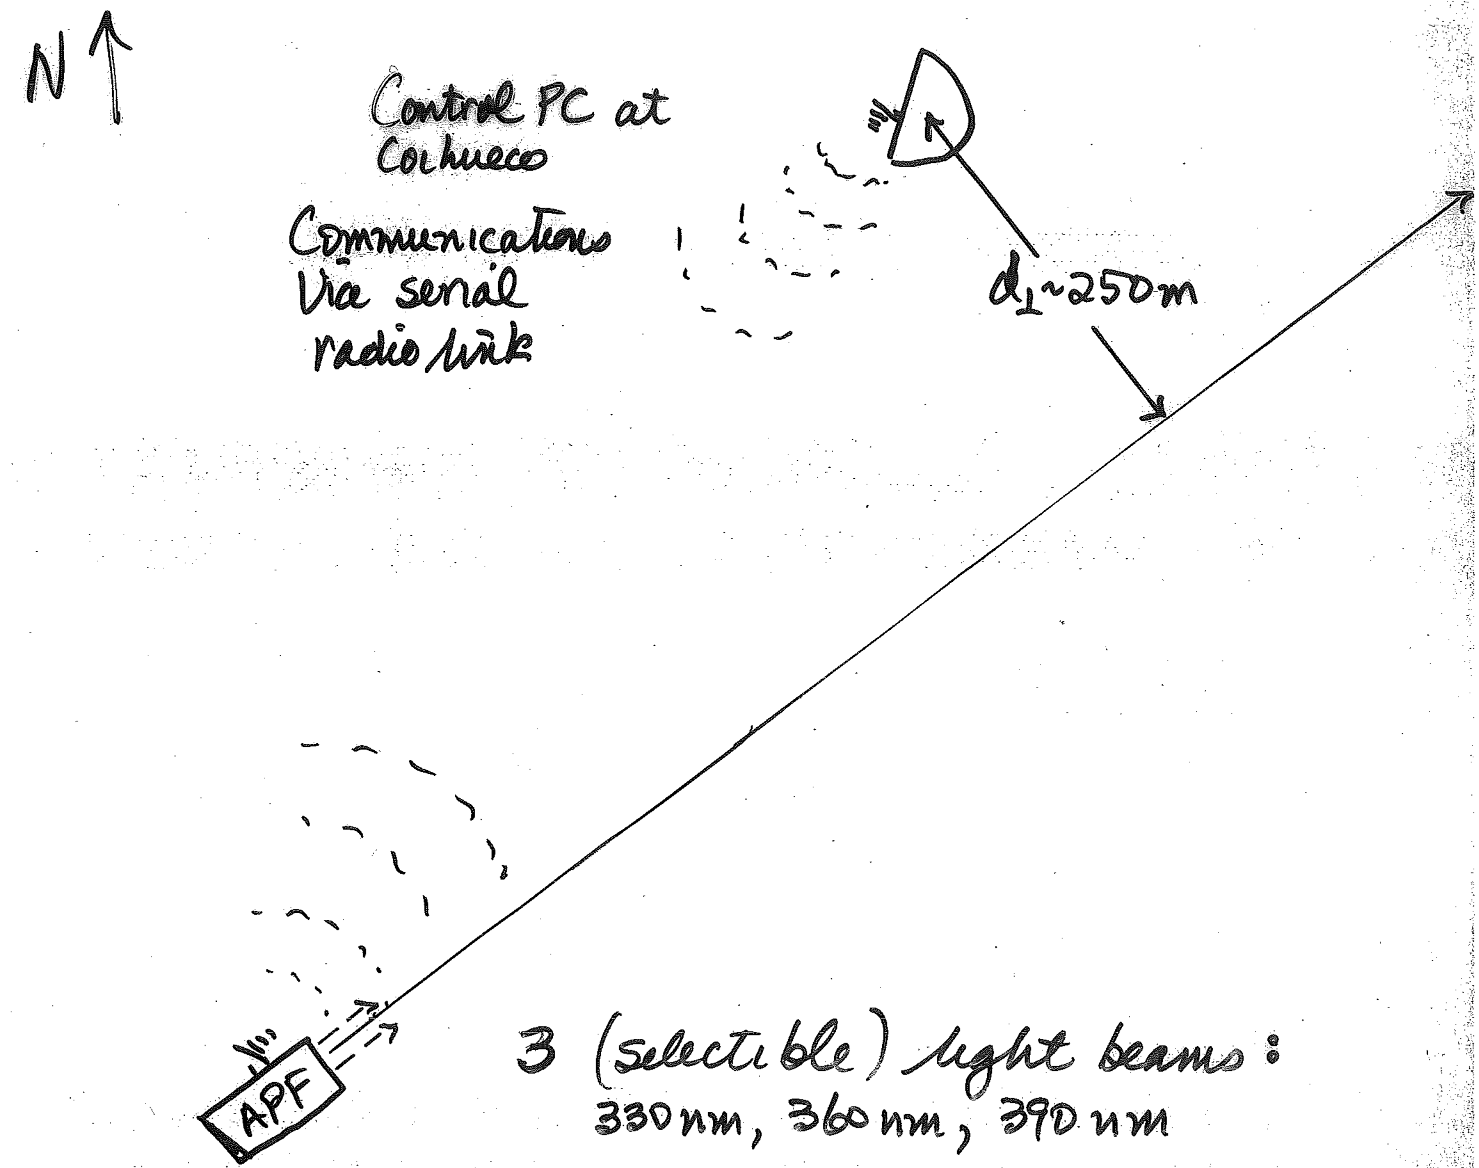
APF Source at Coihueco



3 (selectible) light beams:
330 nm, 360 nm, 390 nm

Triggered on "GPS second" + fixed offset

<u>NO</u> moving parts (other than relays)

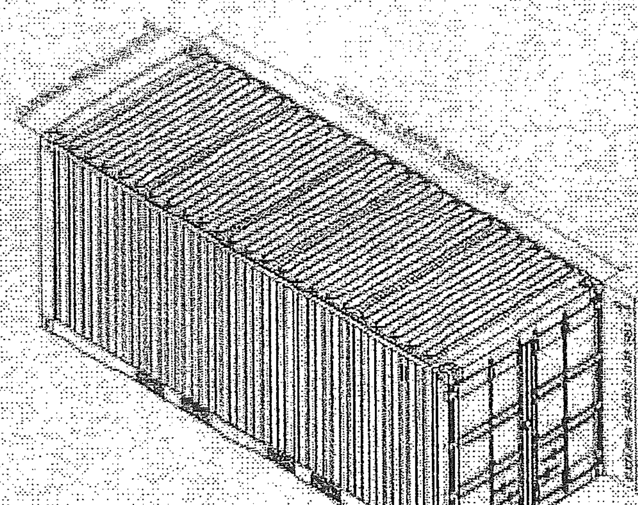
20' DOUBLE DOOR ONE END	Tare Weight	Payload	Gross Weight	Cubic Capacity
LBS.	4,960	47,950	52,910	1,096 CU.FT.
KG	2,250	21,750	24,000	31 CU.M.

ALL NEW CONTAINERS ARE MANUFACTURED TO THE LATEST ISO STANDARDS.

— STANDARD FEATURES —
- Corrugated steel sides, and roof
- 14 gauge locking steel double end swing doors
- 1⅛" thick marine wood floors, forklift tested to 16,000 lbs per 44 square inches
- Tie down steel lashing rings, 4400 lbs. cap. each
- (2) way laden fork lift pockets
- Vents, (2) each

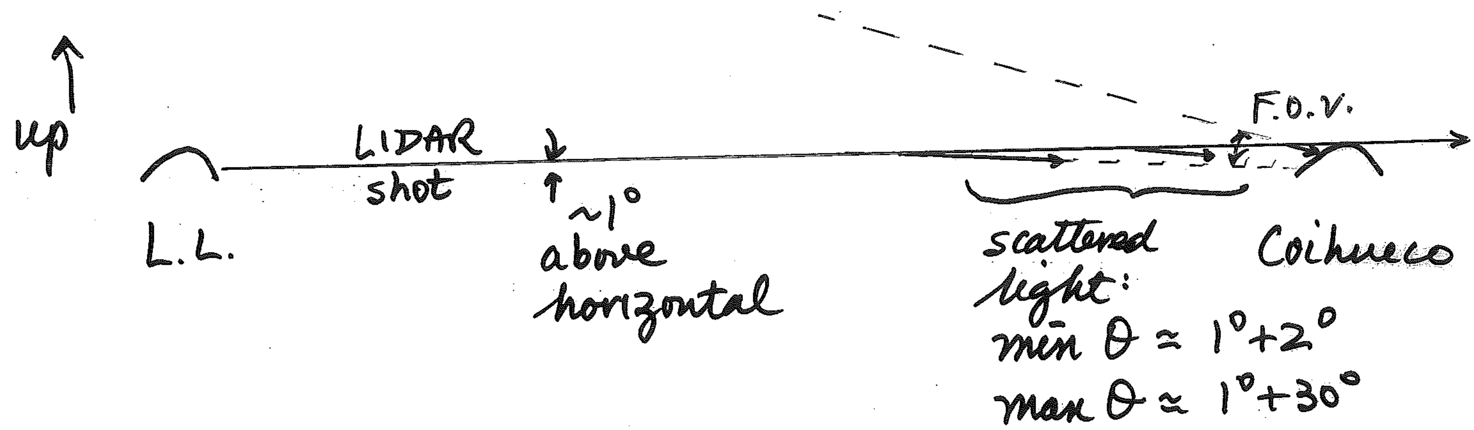
— OPTIONAL FEATURES —
- 2nd set of (2) way unladen fork lift pockets
- Manifest box (2) each
- Adjustable shelving brackets (6) sets
- Decking and shoring beams (18) each



PART # SB861

F.D. camera readout for "glancing shots" (to measure APF at small scattering angles)

1. What is the "geometry"?



✓ Need good (precision) LIDAR pointing

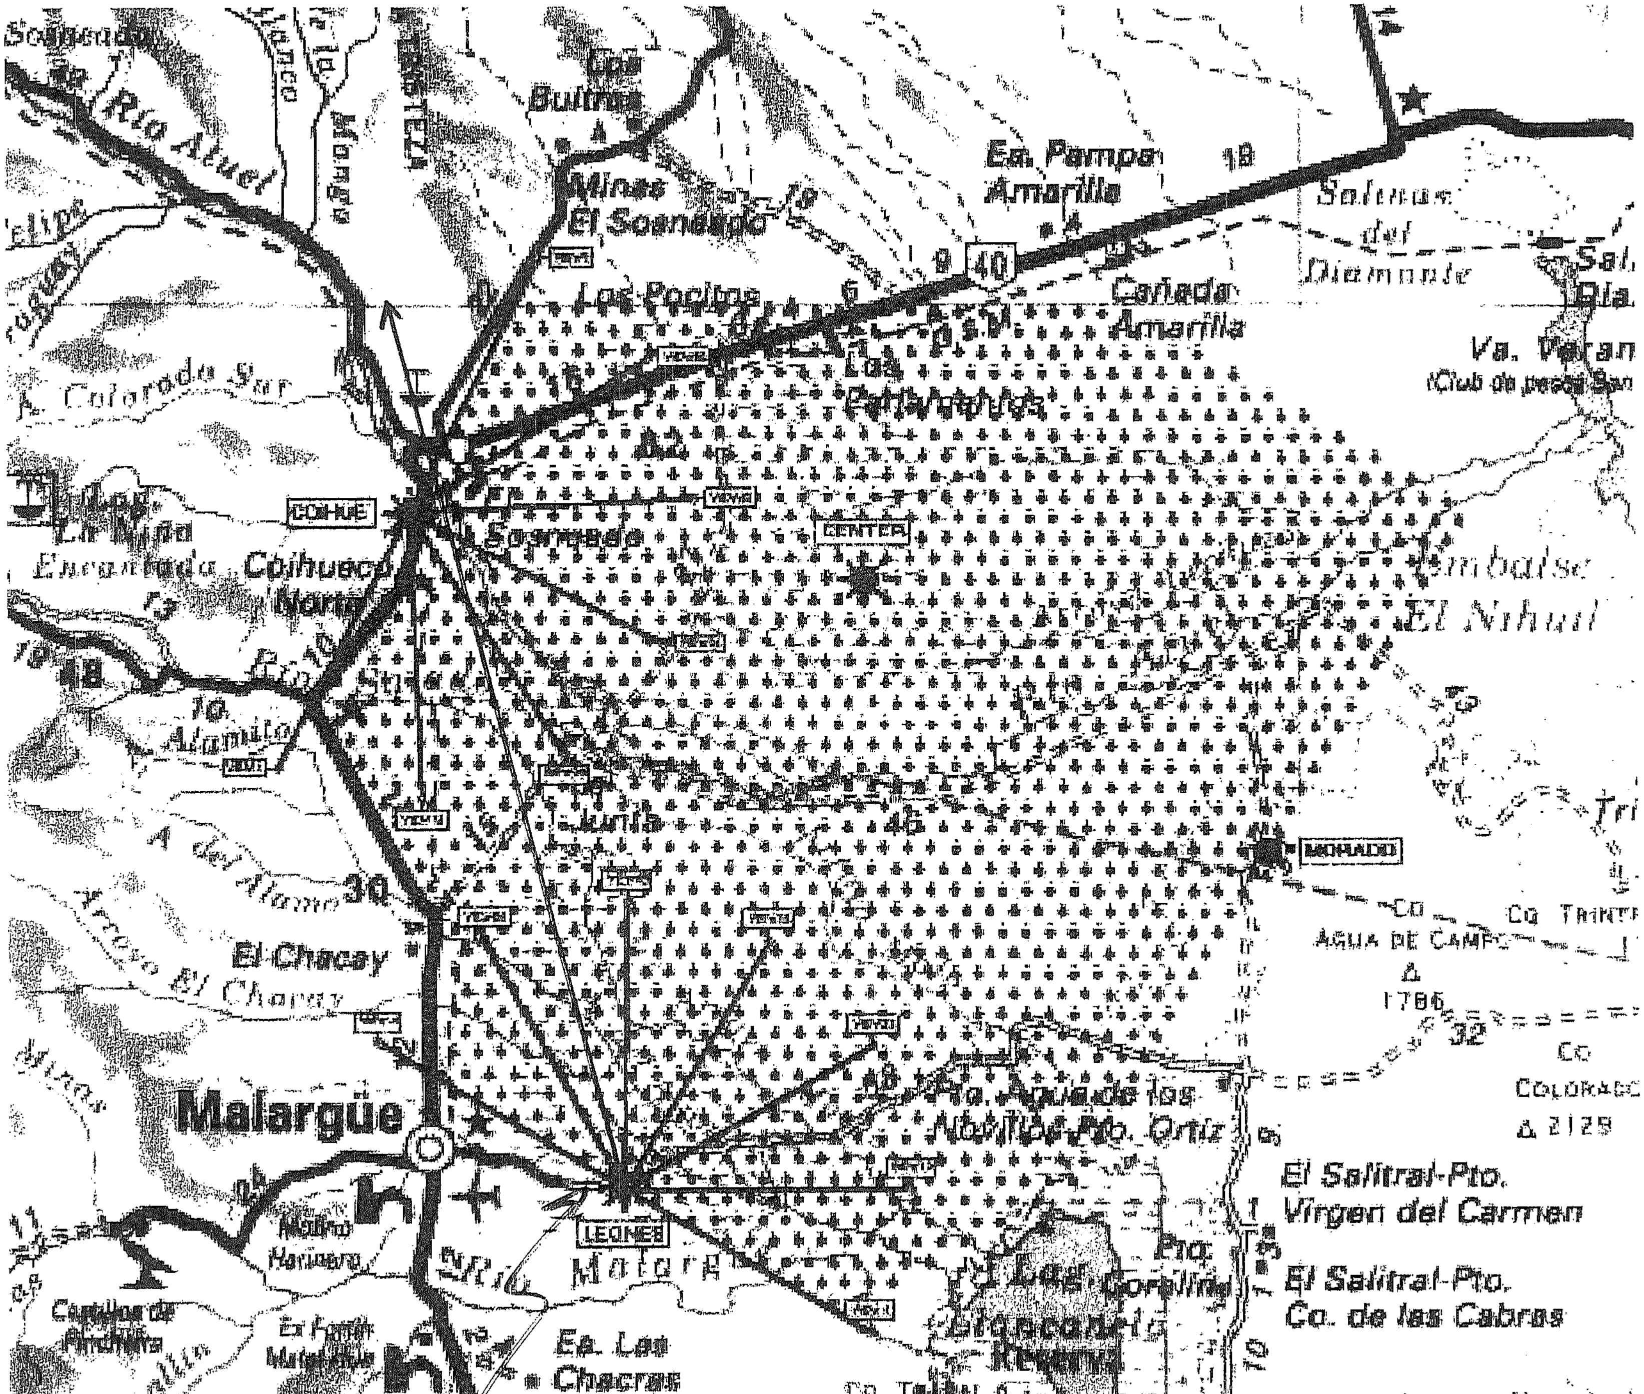
✓ Need to minimize (then vary) height where atmosphere is "monitored".
At "1°" the height difference ≤ 45 km × tan 1° = 0.79 km

2. For subtraction of multiple scattered light:

a) need to read out most of camera, ie many pixels on either side of "track"

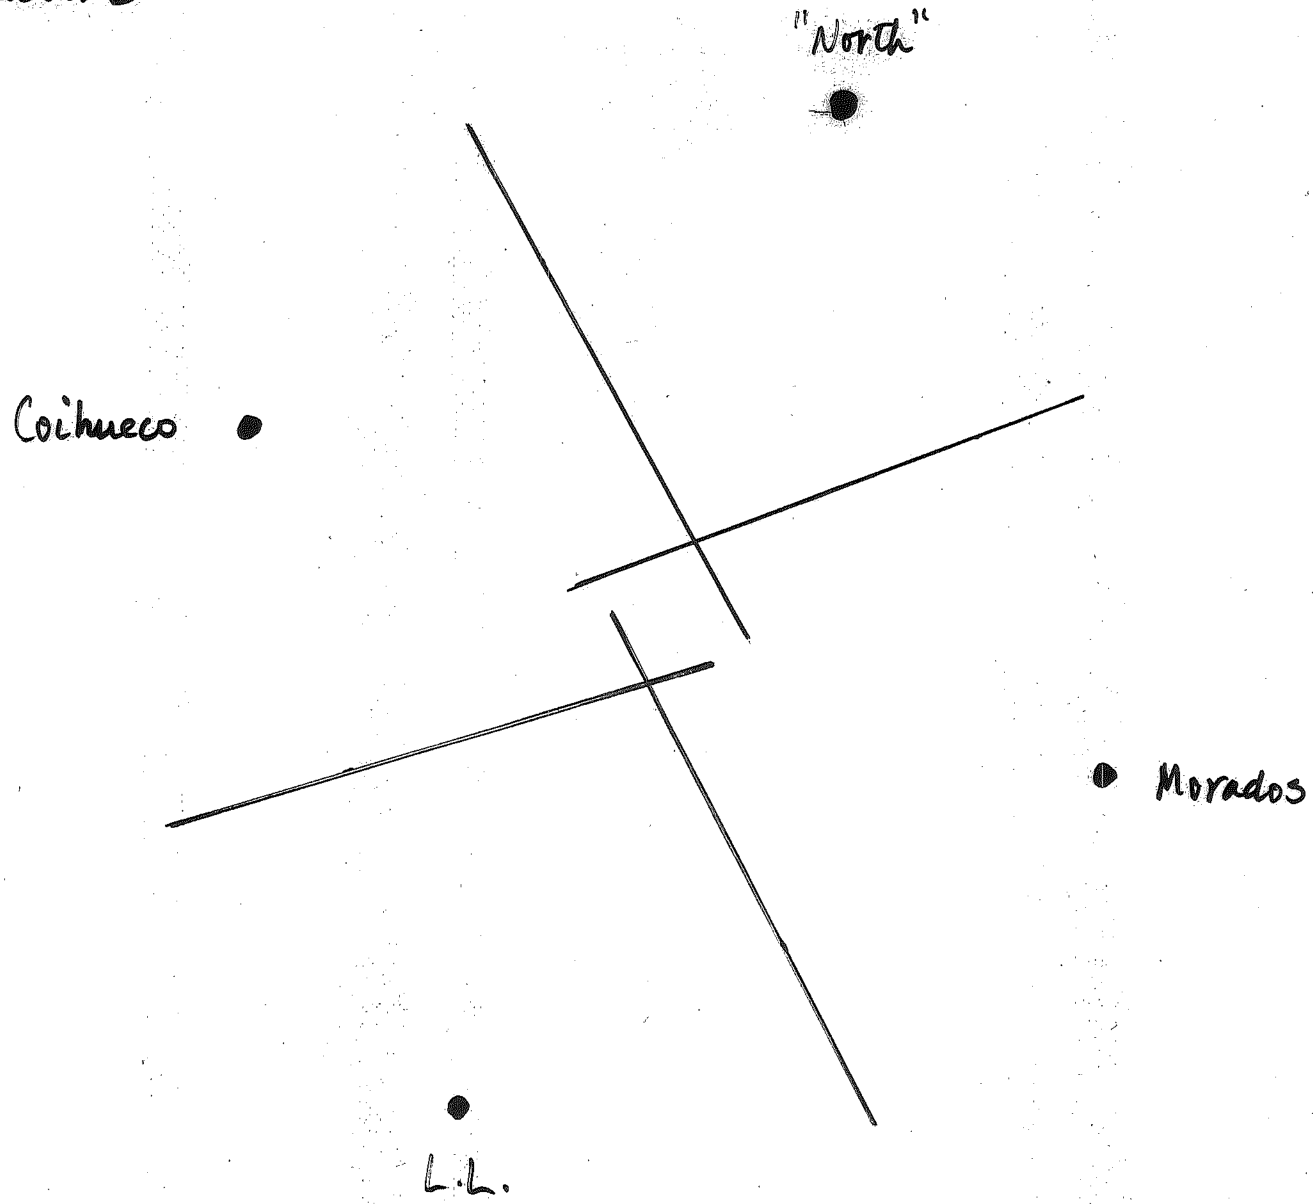
b) need to read out many more time bins "than usual"

This monitors M.S. light to allow subtraction w/o simulation



Example of "near grazing" LIDAR shot.

"Triple Point"
Vertical Lasers



Fixed, Low Power, N_2 lasers
"behind" each F.D.

<u>IF</u> with additional experience we find that vertical (laser) shots (from the F.D. center) provide a useful "flat field" illumination ...

<u>THEN</u> we should consider installing an inexpensive N_2 laser at each F.D.

Then on uniform, clear nights (as seen by the LIDAR(s)) perhaps 10~100 vertical N_2 laser shots would be fired to monitor the <u>individual</u> <u>AND</u> <u>telescope to telescope</u> relative performance.
